

Game Night wagering — the whole loop

One pari-mutuel pool per game. Chips are virtual, per-night, and derived from the event log — no balances stored anywhere.

1

A live game starts

Ann (home) vs Bob (away), with Cyd in the night's pool but sitting out. The Bets panel appears under the team cards with an empty book.

```
POST /game-nights/:id/games → bets: []
```

2

Anyone in the pool stakes chips

Pick who's betting, pick an outcome, enter a stake (1–1,000,000 whole chips). One bet per gamer per game — betting again replaces. Participants may back only their own side; draw is blocked for them.

```
POST .../bets → 201 book · 400 outcome_not_allowed
```

3

The book locks

Manually with the Lock button — or automatically the moment someone opens the TV photo capture, because a result is about to be visible. Locking is idempotent; late bets get a 409.

```
POST .../bets/lock → betsLockedAt · late bet → 409 bets_locked
```

4

The result is recorded

The worker settles the pool: backers of the actual result split the whole pot pro-rata to their stake. If nobody backed the result, every stake is refunded. The split is written into the `game_recorded` event as `wagers`, then the live rows are deleted.

```
the event payload is the durable record
```

5

“Chips tonight” updates

Standings are recomputed from the night's `game_recorded` events on every read — interrupted games discard their bets, voided games drop out automatically. Then the next game opens a fresh book.

```
GET .../chips → positions + lastGameDeltas
```

Step 1. A 1v1 goes live — the Bets panel appears with an open, empty book.

1 vs 1 • Manual matchup

HOME

Ann

AWAY

Bob

Bets

Pot 0 chips

Home pays —

Draw pays —

Away pays —

No bets yet.

The multipliers show a dash until an outcome has backing — a winning chip returns $\text{pot} \div \text{chips backing that outcome}$, and there is no pot yet.

Step 2. The outcome buttons adapt to who is betting. The server enforces the same rules — the UI is a convenience, not the gate.

Ann is betting (playing home)

Ann ▼

Home

Draw

Away

You're playing home — you can only back Home.

Cyd is betting (sitting out)

Cyd ▼

Home

Draw

Away

Why draw is blocked for players: a draw stake would pay a participant for *not winning* — the same perverse incentive as backing the opponent, only softer. Non-participants in the night's pool may back anything. Gamers outside the pool can't bet at all (400 gamer_not_in_pool).

Step 3. Ann backs Home for 50; Cyd backs Draw for 50. One pool, moving odds.

Bets

Pot 100 chips

■ Home 50 ■ Draw 50 Away 0

Home pays	Draw pays	Away pays
2.0×	2.0×	—

Ann — home — 50	×
-----------------	--------------------------------

Cyd — draw — 50	×
-----------------	--------------------------------

Betting again *replaces* your bet — never adds a second one. The × removes it while the book is open. Stakes are whole chips, capped at 1,000,000 so the integer split always balances exactly.

Step 4. Before the score can be seen, the book closes. The panel turns read-only.

Bets locked

Pot 100 chips

Ann — home — 50

Cyd — draw — 50

LOCK

Tap **Lock bets** — or just open the **TV photo capture**: pointing a camera at the score means a result is imminent, so the capture locks the book automatically.

200

Locking twice returns the same timestamp — idempotent, so a double tap or a re-opened camera is harmless.

409

Any bet after the lock is refused:
`{"error": "bets_locked"}`

Step 5. The result is recorded — the worker settles the whole pot among the backers of the actual result, pro-rata to their stake.

Final score **2 : 1 — Home win** (Ann)

The split — pot 100, winners' side backed 50

FORMULA payout = stake × pot ÷ chips backing the winning outcome

ANN ■ 50 × 100 ÷ 50 = **100 chips back**

CYD ■ backed draw → **0 chips back**

GAMER	BACKED	STAKE	PAYOUT	NET
Ann	■ Home	50	100	+50
Cyd	■ Draw	50	0	-50

Where it lands: the settlements are written into the `game_recorded` event payload as an optional `wagers` field, and the live `bets` rows are deleted. The event log is the only durable record — there is no balance column to drift.

Edge cases: nobody backed the result → every stake is refunded (payout = stake, everyone nets 0). Game interrupted → bets are discarded with no settlement. Game later voided by an admin → it simply drops out of the derived standings.

Step 6. After settlement the game card clears and “Chips tonight” appears below the live section — so the result doesn't flash and vanish with the card.

Chips tonight

Ann

+50 last game **+50**

Cyd

-50 last game **-50**

Positions are **derived, not stored**: every read replays the night's `game_recorded` events and sums each gamer's `payout - stake`. That's why voided games disappear from the standings automatically, and why the panel stays readable after the night completes. The next game starts a fresh, empty book — back to Step 1.
